OS CASREACT 144:6402

AB Cyclization of the α -ammonio distonic radical cation analogous to a 5-hexenyl system with Me substituent at 5 position and generated from α -[N-(3-methyl-3-butenyl), N,N-(dimethyl)] ammoniomethyl iodide via radical conditions, was studied by the unimol. vs. bimol. competition experiment. Thus, under pseudo first order conditions, using nBu3SnH as reducing agent and photolytic initiation, the cyclization constant was determined as $k_c = 2.9 \times 10^7$, which means that the rate is very fast and the cyclization highly regioselective for the formation of pyrrolidinic ring systems substituted at 3 position, with recognized synthetic potential.

AB A new approach to optically active N-methylamino acids was presented, relying on stereoselective reduction of N-methylisoxazolinium salts with a dioxyethyl side-chain. The diastereoselectivity of the reduction step was studied systematically, in comparison with that of resp. isoxazolines. A two-step transformation of isoxazolinium salts - with $\text{NaBH}_3(\text{OAc})$ and subsequent catalytic hydrogenation as well as a one-pot reduction by catalytic hydrogenation led to high (95:5 and 87:13) diastereomeric ratios of protected erythro-N-methylaminopentanetriols. The hydroxyethyl side-chain was elaborated by oxidation to afford the β -N-methylamino acid I, exemplifying the potential of this strategy.

AB Amines were previously reported to catalyze the epoxidn. of alkenes using Oxone (2KHSO₅+KHSO₄+K₂S₂O₈), and significant levels of asym. induction were observed. From screening amines based on 2-substituted pyrrolidines, it has now been found that more consistent and reproducible results are achieved with the HCl salt of the amine compared to the amine itself. Up to 66% ee was achieved in epoxidn. of 1-phenylcyclohexene. The chiral amine could be reisolated in >90% yield when reactions were conducted at -10°, indicating that the integrity of the amine was maintained during the oxidation process. At -10°, (S)-2-(diphenylmethyl)pyrrolidine 1 reacted with Oxone to give a mixture of ammonium salts containing the peroxymonosulfate salt I. The enantioselectivity obtained with this salt was compared to the amine·HCl salt catalyzed process and identical results were observed, indicating that the true oxidant was the peroxymonosulfate

salt I. The relative rates of oxidation of cis- and trans- β -methylstyrenes together with the p value of 1-arylcyclohexenes were determined. The amine catalyzed process involved electrophilic oxidation. A new mechanism is advanced in which the protonated amine not only acts as a PTC but also activates Oxone, through H bonding, toward electrophilic attack.

AB Disclosed are enantiomerically pure cyclic aminoalc. esters of
arylcycloalkylhydroxycarboxylic acids with at least 90% enantiomeric
excess of the (3R,2'R), (3S,2'R), (3R,2'S), or (3S,2'S) configured

enantiomer. Thus, [(cyclopentyl (or cyclohexyl) hydroxyphenylacetyl)oxy] pyrrolidinium salts I (R = cyclopentyl, cyclohexyl, X = bromide, iodide, fluoride, chloride) were prepared by reacting (3R) or (3S)-1-methyl-3-pyrrolidinol with the corresponding phenylacetate, followed by preparation of the tartrate intermediates and quaternization. Inhalable powder and aerosol formulations of the compds. were also prepared. The muscarinic binding affinity of I were examined using rabbit vas deferens, guinea pig atrium, guinea pig ileum, and human M1, M2, and M3 receptors.

AB The authors characterized phenoxy radical cation I as a proper model for H-bonded phenoxy radicals in biol. systems. In this model, an intramol. proton migration occurs at its redox process with the min. nuclear motion requirement. Probably some basic functional group located near the tyrosine residue in an active site of enzyme may control the redox potential of the tyrosyl radical with H bonding.

 AB Convenient oxidative generation and facile 5-exo cyclization of tertiary aminium radical cations to give distonic 2-substituted pyrrolidinium radical cations is reported. These can be further oxidized to 1,3-dications and trapped by nucleophiles as water, alcs., or chloride ion. Preliminary mechanistic issues and implications will be presented.

LA English

AB α -Ammonium distonic radical cations have for the first time been purposefully generated and their reactivity studied in solution using both LFP and competition expts. Such species exhibit behavior which is typical of a carbon-bound radical, and rate consts. of cyclization of unsubstituted-, 5-phenyl-, 5,5-diphenyl-4-pentyldimethylammoniomethyl radicals ($1.5 + 10^6 \text{ s}^{-1}$ at 33° , $1.7 + 10^7 \text{ s}^{-1}$ at 25° , and $3.0 + 10^7 \text{ s}^{-1}$ at 25° at 33°) indicated that they are somewhat more reactive than analogous hydrocarbon radicals.

AB Two equivalent of boron trifluoride-diethyl ether complex or 1 equiv of trifluoromethanesulfonic acid reacts with C-[bis(diisopropylamino)phosphino]-C,P-bis(diisopropylamino)phosphaalkene $\text{R}_2\text{NP}:\text{C}(\text{NR}_2)\text{P}(\text{NR}_2)_2$ ($\text{R} = \text{Me}_2\text{C}$), cleaving one of the diisopropylamino substituents at the σ_3 -phosphorus atom. This affords the corresponding intermediate $1\sigma_2,3\sigma_2$ -diphosphaallylic cation I, which is isolated as the four-membered-heterocycle II. Addition of a catalytic amount of base to II leads to a $1\sigma_1,3\sigma_3$ -diphosphaallylic cation intermediate III, which is isolated as the diphosphirenium salt IV. Mesityllithium and the lithium salts of diisopropylamine or dicyclohexylamine react at the σ_2 -phosphorus atom of the cationic heterocycles II and IV, affording the corresponding phosphaalkenes. All the results demonstrate the high electrophilicity of low-coordinated diphosphaallylic cations, which are only isolable as intramol. donor-acceptor complexes.

AB The title process providing high-performance coatings involves application of metallic pigment-containing base coat and clear topcoat, containing curing catalysts containing onium salts comprising (non)cyclic ammonium cation or sulfonium cation with R1R2R3C6H2C(R4)(R5) group bonded to N or S and AsF-6, SbF-6, BF-4, PF-6, ClO-4, FeCl-4, CF3SO-3, aromatic or aliphatic sulfonic or carboxylic acid ion. Acrylic or polyester vehicles were used with acrylic microgels, aminoplast hardeners, Al pigments, and curing catalysts, e.g., 1-(4-methylbenzyl)tetrahydrothiophenium hexafluoroantimonate, N-(2,6-dichlorobenzyl)-4-cyanopyridinium p-toluenesulfonate, N-(4-chlorobenzyl)-N,N-dimethylanilinium 4-dodecylbenzenesulfonate, N-(2-methylbenzyl)-4-cyanopyridinium hexafluorophosphate, etc., at coating solids content $\geq 45\%$.

ASSIGNMENT HISTORY FOR US PATENT AVAILABLE IN LSUS DISPLAY FORMAT
 GI

AB A heat-sensitive coloring material contains (A) an electron-donating coloring organic compound, (B) a heat-activating agent selected from cyclic sulfonium salts [I; R1 = H, R, OR, halo, NO2; R = (OH-substituted) C1-12 alkyl, cycloalkyl; X = AsF6, SbF6, BF4, BF6, PF6, ClO4, FeCl4, CF3SO3, RSO3, RCO2], (R2)3C6H2C(R3)2A+X- [R2 = COR, R1, OH, cyano, NH2; R3 = H, R, halo; A = Q, N(R4)3; when A = N(R4)3, at least one of R3 ≠ H; R4 = (un)substituted C1-12 alkyl, alkenyl, or Ph; R, R1, X are defined as above], and heterocyclic ammonium salts [II; R5 = H, R, C2-3 alkenyl, R8; R6 = R, C2-3 alkenyl, R8; R7 = H, OH, R, OR, R8; R8 = (un)substituted Ph; m = 1-4; R, X are defined as above], and (C) a color-developing agent selected from aromatic compds. (III; Ar = benzene or naphthalene ring; R9 = H, OR, O2CR, COR, halo, NO2; R is defined as above) and diphenylmethane derivs. (IV; R is defined as above), and (D) a resin having number-average mol. weight 500-50,000. The recording material is not colored in the presence of an organic solvent, thus is easy to handle, and also the choice of heat-activating agent (B) allows the recording material to be rapidly colored at desired, relatively low temperature. Furthermore only a very small amount of the expensive heat-activating agent is required to effectively initiate the decomposition of the tert-butoxyphenyl group to hydroxyphenyl group in the coloring agent and subsequent coloration, and thus the recording material is economically manufactured.

 OS CASREACT 117:191985
 AB The title reactions of chromium-containing carbene complexes (CO)5Cr:C(R1)N(R2R3) [R1 = H, Me, Ph; R2 = Me; R3 = Me, cyclopropyl, cyclopropylmethyl; R2R3 = (CH2)5] 8 and (CO)5Cr:C[(CH2)3C.tplbond.CPh]N(R1R2) [R1 = R2 = Me; R1R2 = (CH2)5, (CH2)4] 9, bearing alkyl groups of low migratory aptitude on nitrogen were examined. In contrast to complexes in which nitrogen bears either an alkyl and an allyl or a benzyl group or is part of a strained cycle, which give heterocycles upon alkyne/CO insertions followed by nitrogen-to-carbon migrations, complexes 8 and 9 lead to stable nitrogen ylides, which could be fully characterized by x-ray crystallog. in the case of 8 [R1 = H, R2R3 = (CH2)5] and 9 (R1 = R2 = Me). Moreover, in the case of complexes of the general structure 9, ketene precursors of the ylides could either be detected (R1 = Me, R2 = CH2Ph) or isolated and characterized [R2R3 = (CH2)5]. The new ylide complexes undergo, upon moderate heating, Stevens-type rearrangements to the expected heterocyclic compds. as a result of nitrogen-to-carbon migrations of various alkyl groups, and upon treatment with dimethyldioxirane, they undergo oxidation to lactone complexes.

AB The title polymerization catalysts are quaternary ammonium salts such as N-(α , α -dimethylbenzyl)pyridinium hexafluoroantimonate (I), N-(α -methylbenzyl)-N,N-dimethylaniline hexafluoroantimonate, N-(α -methylbenzyl)-pyridinium- hexafluoroantimonate, etc. Thus, 90 parts (solids) 1.88:2.59:28.11:25:30 iso-Bu methacrylate-Bu acrylate-Me methacrylate-styrene-glycidyl methacrylate copolymer was mixed with 2 parts I, coated on tin plate, and baked to prepare a colorless coating.

AB Thermolysis of 3-aryl-1,1-dimethyl-2-pyrazolinium fluoroborates I (R = H, Me, MeO, Br, O₂N) gives isomeric mixts. of 3-aryl-1-methylpyrazoles II and 5-aryl-1-methylpyrazoles III as major products

in complete contrast to the corresponding acyclic analogs. 2,6-Diaryl-3-methylpyridines IV were isolated only in trace quantities. The probable reasons for this unique behavior were explored using semi-empirical calcns., non-kinetic methods and radiolabeling expts. A pathway is proposed.

AB Reaction of the tetrafluorophosphoranes RPF_4 ($\text{R} = \text{Me}, \text{Ph}, \text{C}_6\text{F}_5, \text{Me}_3\text{SiCH}_2, 2,5\text{-Me}_2\text{C}_6\text{H}_3$) with N,N,N' -trimethyl- N' -(trimethylsilyl)ethylenediamine gave the corresponding trifluorophosphoranes I by cleavage of the Si-N bond and elimination of Me_3SiF . In an analogous reaction the difluorophosphoranes $\text{R}_1\text{R}_2\text{PF}_2\text{NMeCH}_2\text{CH}_2\text{NMe}_2$ ($\text{R}_1 = \text{R}_2 = \text{Ph}$; $\text{R}_1 = \text{Ph}, \text{R}_2 = \text{C}_4\text{H}_4\text{N}$) are formed. Some of these N,N,N' -trimethylethylenediamine-substituted di- and trifluorophosphoranes react with PF_5 as a Lewis acid to form the corresponding azonium hexafluorophosphates II ($\text{R} = \text{Me}, \text{Me}_3\text{SiCH}_2, \text{Ph}$, $\text{X} = \text{PF}_6$) as a result of fluoride abstraction and intramol. $\text{Me}_2\text{N} \rightarrow \text{P}$ donor-acceptor interaction. II ($\text{R} = \text{NMe}_2, \text{X} = \text{Cl}$) shows dynamic behavior in solution. An exchange process is observed for the axial and equatorial fluorine atoms by ^{19}F and ^{31}P NMR spectroscopy. X-ray structure anal. of the compds. II reveals the expected trigonal-bipyramidal geometry at phosphorus. The ethylenediamine ligand forms a chelate ring, whereby one axial and one equatorial site are bridged. The coordinate P-N bonds are very long (up to 207 pm).

AB The title materials contain a compound of the formula I or II (R, R1 = H, alkyl, aralkyl, aryl; X⁻ = BF₄⁻, PF₆⁻) at least on their surfaces. The materials are useful for charging electrostatog. toners to provide adequate neg. charges. An Fe powder carrier was dispersed in a solution of II (R, R1 = tert-Bu; X = BF₄⁻) (III) in MEK, dried, and the resulting coated carrier mixed with a toner prepared from D-125 (polystyrene) and Raven 3500 (C black) to give an electrostatog. developer, which had a triboelec. charge of -11 μC/g as compared with -2 μC/g for a control using a carrier containing no III. The developer gave high-quality images with good line reproduction and gradation and without fog and showed improved durability as compared with the control.

AB 1,1-Dialkylhydrazines and PhOCCl:NCOC1 react to give excellent yields of anhydro-1,1-dialkyl-5-oxo-3-phenoxy-1,2,4-triazolium hydroxides I ($\text{R} = \text{R1} = \text{Me, Et, PhCH}_2$; $\text{R} = \text{Me, R1} = \text{Et}$). The reaction is regiospecific, and the same products are obtained from PhOC(:NH)NHNRR1 and phosgene. Thiophosgene and isocyanide dichlorides give exocyclic sulfur and nitrogen containing zwitterions, resp. Alkylation of the triazolium hydroxides occurs exclusively on N-2, and an O-Ph to N-Ph migration was observed at .apprx.205°. Via dynamic NMR expts., the diastereiotopic methylene hydrogens of the benzyl groups attached to the quaternary nitrogen atom gave thermodyn. exchange data of $E_a = 21.7 \pm 0.7 \text{ kcal mol}^{-1}$, $\Delta H_{\text{thermod.}} = 21.0 \pm 0.4 \text{ kcal mol}^{-1}$, $\Delta S_{\text{thermod.}} = 6 \pm 1 \text{ eu}$, and $\Delta G_{\text{thermod.}} = 19.3 \pm \text{kcal mol}^{-1}$.

 OS CASREACT 99:122390
 AB RSCH₂CH₂NMe₂ (R = alkyl) and 3-methylthiazolidines underwent N-
 methylation both with Me₃O⁺BF₄⁻ and with MeI. With 2-MeSC₆H₄NMe₂ the
 main reaction was S-methylation. On the other hand, in 2-
 EtSC₆H₄NMe₂, S-methylated product was major with MeI, while N-
 methylated product was major with Me₃O⁺BF₄⁻. In the N-Et or N-benzyl
 derivative, only S-methylation occurred with both reagents. 3-Methyl-
 2,2-diphenyl-2,3-dihydrobenzothiazole gave S-methylated product with
 Me₃O⁺BF₄⁻, suggesting that S-methylation becomes major when the 2-
 substituent is bulkier.

4-Methyl-3,4-dihydro-2H-benzo[b][1,4]thiazine was N-methylated with Me₃O⁺BF₄⁻ while it gave S-methylated product with MeI. Phenothiazines and 1-dialkylamino-8-(methylthio)naphthalenes gave only S-methylated products. The possibility of intramol. interaction between sulfonio and amino groups has been discussed based on NMR data.

AB H₂NN+Me₂CH₂C(COPh):CHPh Br⁻, prepared from BrCH₂C(COPh):CHPh and H₂NNMe₂, did not undergo a [2,3]-sigmatropic rearrangement, but rather formed I by intramol. aldol addition. The intermediacy of the dipolar intermediate II in the [2,3]-sigmatropic rearrangement of HN-N+Me₂CH₂C(:CH₂)COPh was demonstrated by the course of the reaction of PhCOC(CH₂Cl):CH₂ with Me₂NNH₂. Pyrazolidinium salt III was formed in Me₂CO, but in Et₂O salt IV was formed. Adding EtN(CHMe₂)₂ to the

ether gave 2:3 Me₂NNHCH₂C(:CH₂)COPh(V)-IV. II was a common intermediate for IV and V; it was not completely certain that II was an intermediate for V.

AB Pt complex I was prepared in 78% yield by treating [Me₂N:CH₂]Cl with
 (Ph₃P)₃Pt in THF. Heating I in MeCN gave carbene cis-
 (Ph₃P)Pt(:CHNMe₂)Cl₂ (II). The crystal structures of I and II were
 determined I has Pt-L distances of P, 2.223 (2); Cl, 2.362 (2); N,
 2.134 (4) and C, 2.017 (5) Å. The Pt-C distance is the shortest
 presently known for an sp³ C (without F substituents) bonded trans to
 Cl. II has Pt-L distances of P, 2.220 (2), Cl(1), 2.347 (3), Cl (2),
 2.345 (3) and C, 1.96 (1) Å. The dihedral angle between the carbene
 and coordination planes is 84°.

AB The reactions of pyrylium salts with a variety of mono- and disubstituted hydrazines were studied. The products were generally either the appropriate pyridinium salt or the ring cleavage products; in 2 cases 2-pyrazoline derivs. were obtained. E.g., 2-ethoxycarbonyl-4,6-diphenylpyrylium tetrafluoroborate (I) with PhNHNH₂ (MeOH, 20°, 30 min) gave 73% PhNHN: CPhCH₂CPh:CHCOCO₂Et, with H₂NCONHNH₂.HCl (aqueous EtOH, NaOH, reflux, 3 h) I gave the pyridinium salt II (56%), and with p-O₂NC₆H₄NHNH₂ (EtOH, 20°, 2 h) the product was III (59%). As was observed for several compds. derived from I, II readily cyclized [(MeOCH₂)₂, K₂CO₃, 20°, 2 h] to give 83% IV.

AB Benzothiazolines I (R = 4-MeOC₆H₄, 4-MeC₆H₄, Ph, 4-ClC₆H₄, Me, H) were methylated by Meerwein reagents to give benzothiazolinium salts II. Treating I with Et₃O⁺BF₄⁻ gave isomeric III. The selectivity of R₃O⁺BF₄⁻, MeI, and MeI-AgClO₄ in N- and/or S-alkylation of related compds. were examined. Thus, when an N atom is in resonance with 2 benzene rings, i.e., phenothiazine, alkylation occurs on S even with R₃O⁺BF₄⁻. Alkylation of N and S competes when the N is connected to one C₆H₅ ring. Treating II with (Me₂CH)₂NLi and BuLi caused a Stevens rearrangement. Removal of a proton at C-2 by (Me₂CH)₂NLi gave π-type cyclic ammonium ylides as intermediates, which gave rearrangement products in moderate yield. Direct attack at the ring S by BuLi gave ammonium ylide IV, which gave mainly an unusual Stevens rearrangement to 2-(BuS)C₆H₄CHRNMe₂ by participation of the ortho-BuS group.

OS CASREACT 76:24570

AB Preparation and isolation of 2-aryl-substituted aziridinium (ethyleniminium) salts are described for the first time. Ethyleniminium ions of this type were previously implicated as intermediates in adrenaline blockade. Using a series of 2-aryl-1,1-dimethylaziridinium fluoroborates with BzH, the stereochemistry of the ring expansion reaction of aziridinium salts with aldehydes, was determined. This representative of a family of aziridinium ring expansion reactions was highly stereoselective, since only 5-aryl-3,3-dimethyl-2-phenyloxazolidinium fluoroborates were produced. The kinetics of the reaction, determined by following the NMR spectra, showed the reaction to be first order in aziridinium salt, zero order in BzH, and dependent on the substituents on the aryl ring. A Hammett correlation with σ^+ , $\rho^+ = -1.25$ was observed. The stereochem. and kinetic findings preclude several mechanisms including concerted cycloaddn. and favor the intermediacy of aminocarbonium ions.
